ABSTRACT

PURPOSE: To omit such manual operations to dial the number of the remote side, to push a memory button, etc., and to improve operability by reading the information on characters, etc., to recognize the contents of this information sending this recognized information to a communication control part as the dial information and then transmitting automatically the circuit dial information from the communication control part.

CONSTITUTION: A reading part 11 reads the character information written in an upper blank area of an original like a document, a drawing, etc. An information comparing part 13 compares the information received from a recognizing part 12 with that stored in a memory part 15. Then the telephone number information corresponding to the coincident information if obtained is taken out of the part 15 and outputted to a communication control part 18. The part 18 controls a circuit switch 16 to catch and release circuits. Then a dial signal transmitting part 14 is driven based on the telephone number information received from the part 12 and the part 13 respectively. Thus the dial signals corresponding to these telephone number information are transmitted to circuits.
